A recent message in the [ajaxCFC group](#) asked about the DRWUtil.addRow() function; the truth is that I had never used it. I include the utils library because there are other elements that I find useful, but I had never given the addRows a try.

Enough said, since I include the file, I guess I need to support the built-in functionality, but the addRows out-of-the-box was accepting arrays and objects. I serialize the ColdFusion queries into a more complex object which was not recognized by the addRows function, so I modified it to add wddx support. When you pass a wddx object to addRows it will now automatically populate your table, even without the need to cell functions (like the array or object methods).

You can find an example [here](#), and download the latest release (0.63) with the code changes, example, and updated documentation from the [projects page](#).

I'd like to thank again Joe Walker for his great effort in putting DRW together, and I will email him the changes to add wddx support for his next release.
